Protecting AGAINST Corrosion

Automotive manufacturers go to great lengths to protect their vehicles from corrosion. It is our job in the auto body industry to use the correct products and processes during a repair to insure that we duplicate the manufacturer's protection. There are several options on exterior panels but the overlooked areas are what will create issues after a few years of our Midwest winters. Areas such as pinch welds, inside frame rails and the back side of repaired panels need to be protected to get it back to the "pre accident condition". Products such as e-coat, epoxy, etch and weld through all work to help prevent corrosion, under coatings are also important (either petroleum-based or wax-based). These are typically sprayed in areas such as trunks, inside doors and frame rails. Primarily sprayed with an aerosol can with a spray wand they can reach in the cavities and enclosed areas. There is an abundant of products and application tools available to make your job easier and to insure your repair will meet factory specifications. If you have any question about corrosion protection, ask one of the staff at **Auto Body Supply** for help in providing the correct product and process for your repair.

PPG WATERBORNE PAINT SIMPLY THE BEST

*Did you know that **PPG** has more shops in the U.S. and Canada using Waterborne Paint than all of the other paint companies combined?*

PPG's Waterborne technology clearly sets the benchmark today. Why? Simply stated, **PPG** has the **BEST** color tools, the **BEST** color match and a **SUPERIOR** product. The competition doesn't come close.

What's quite revealing is that there are almost as many shops outside of the regulated areas using **PPG** Waterborne as those that are required to comply with VOC regulations. This fact validates that the market understands the benefits of **PPG's** Waterborne system because customers are using waterborne even though they are not required to do so. These early adopters represent some of the best-run businesses in the industry.

Contact **ABS** and ask how you can join the rest of the best-run body shops by converting to **PPG** Waterborne now!

NEW 3M BELT SANDER

The **3M** File Belt Sander and matching abrasives are great additions to body shop tool rooms. Technician's use the P36 grit belts for spot weld removal on high-strength and mild steel as well as for grinding in tight areas. The P80 belts are used for weld dressing and refinement. This sander gives you all the cutting power you need to access the tightest corners, tackle small welds and blend finishes. Check out the video at <http://3mcollision.com/products/featured-products/file-belts>
